19.1.55 PrimeCare Enhancements - Projected General Release 8.17.26

Here's What's New in PrimeCare:

Updated Dispensing Machine Labels for Parata®

To support Massachusetts law, except as required by federal law, the prescriber practice name can be printed instead of the prescriber name upon prescriber request for reproductive or gender-affirming controlled substances.

- Added Doctor "Practice Name" and label design (pulled from the Transaction) to the Parata XML programs.
- Added Doctor "Practice Name" to the HL7 interface in field ZAP-111.

Added Time Stamp for Prescriber Last Updated Date

To improve awareness of outdated prescriber credentials, added a "Last Updated by" timestamp to include the user, date, and time to the Prescriber Record > General Information screen.

Made Delivery Address Changes Visible for Patient Security Journals

Delivery address changes were not displaying in the Patient Security Journal. Updated the log file to include these changes and ensure that they are able to be viewed/printed.

Added Maximum Fair Price (MFP) Refund Field to the HL7 Billing Interface

To ensure proper summation of amounts in Epic, added the MFP Refund to the HL7 Billing Interface in field ZRX-69.

Added MFP Refund Label Routine

Added label routine, 818, to print "Est Refund" from the Transaction. Use to print "Est Refund" on label/back tag.

Added New Interfaces

Added the following interfaces:

- Sapphire Electronic Health Record (EHR) - Correctional software that uses HL7 2.2 New and Refill Orders to QS/1 and outbound HL7 2.2 Orders to Sapphire EHR.
- Del monte Assisted Living - Includes outbound HL7 2.5 ADT and Orders to AI Delmonte and Refills to QS/1.
- IntelliVault™ - Controlled Substance Management System that includes outbound HL7 2.2 Orders to IntelliVault. Use label routine, 287, for the prescription number to scan at the machine.
- LTLinx eMAR - Includes outbound HL7 2.5 ADT and Orders to LTLinx. LTLinx sends HL7 2.5 Refills to QS/1.

Added Practice Name to eRx Hard Copy

In compliance with 340B, added the Practice Name to the electronic prescription hard copy, improving compliance visibility.

Note: Change was made for all states except NY, NJ, OH, and IL.

Added Pharmacy Information to Cencora File

Creating a historical file via on-demand reporting for wholesaler, Cencora, was released in Service Pack 53. This initial release did not include required pharmacy data elements in the historical file layout. This enhancement ensures that participating pharmacy information is now captured and transmitted, improving data completeness, and supporting downstream reporting and compliance needs.

Added the following fields to the Cencora file output for the Wholesale History Report (Date Filled Cencora):

- Pharmacy DEA #
- Pharmacy NPI
- Pharmacy Address 1
- Pharmacy Address 2
- Pharmacy City
- Pharmacy State
- Pharmacy Zip

Added Workflow Bypass Option

Added the following to add greater control for when prescriptions enter workflow, particularly in scenarios when workflow processing is unnecessary or creates inefficiencies.

Store Level Options

Added an option, Allow Workflow Bypass, to Store Level Options > Workflow Queue Setup. Default = Unchecked. Select to view logic.

Security Access

Added an option, Workflow Bypass, to Store Control > Security Access > Filling Options (Workflow Options). Default = Unchecked. Select to allow user to bypass workflow.

Filling Option

Added an option, Bypass Workflow, to the Filling Options window. Default = Unchecked. Select to prevent a workflow record from being created for the transaction.

Rx Security Journal

Updated Rx Security Journal to log Bypass Workflow activity including whether the bypass was used, as well as the user that performed the action.

Changed SIG, Image, Drug Image Block Print Options to be Store Specific

Pharmacies with multiple locations may have differing operational and regulatory requirements across stores. To ensure that label printing settings are maintained independently for each location, updated SIG Block, Image Block, and Drug Image Block Print Options to be store specific.

Updated the following print settings to be store specific in Store Control > Label Options > Printing Options > Label Print Options window:

- SIG Block
- Image Block
- Drug Image Block

Effected Label Routines:

- 546 - SIG Block
- 798 - Image Block

These label routines now access the store record as opposed to the host record.

Added Do Not Substitute to Drug for EDI 850 for PBA Health

Pharmacies using robotic dispensing devices require specific medications to be replenished without substitution. Added the following to enable your pharmacy to clearly indicate which drugs should not be substituted when submitting to PBA Health, ensuring accurate replenishment and reducing errors in automated dispensing systems.

Drug Record/Inventory

Added a Do Not Substitute checkbox to the Drug Record > Inventory > Order Details (Packages) section. Default = Unchecked.

Electronic Data Interchange Purchase Order (EDI) 850 File - Inventory > Electronic Drug Reorder > Send an Order

Updated the EDI 850 file to do the following:

- If the Do Not Substitute checkbox is selected on the Inventory Record and the Receiver ID Print Option = PBAHEALTH, the CSH*NS segment is included.

Updated Price Plan Wizard for RedSail Cash

Updated the Price Plan Wizard to automatically configure a Price Plan for RedSail Advantage Services (RAS) Auto Discount when either 028249 or 021908 is entered as the ANSI BIN number. Your pharmacy can create qualifying RAS Auto Discount Price Plans more quickly and consistently, with the wizard automatically applying the required setup.
